Adjustment Introductions

1. Wall bed Gap adjustment

This bed needs to flip up and down, for around the general will be reserved for about 1cm gap to facilitate the use, the diagonal size needs to be corrected before the bed is connected to the wall.

If the left and right gap size uneven, please check the diagonal size of bed frame first, if the diagonal size is right, please adjust the screw clockwise of the smaller gap side , back and forth debugging to the best of the situation

2. Wall bed Spring adjustment

After installing the wall bed, we need to debug spring function device. Close the bed into the angle of 30° , with a wrench to adjust the nut on the screw (Note: clockwise twist tighten the spring tension, counterclockwise twist to loose spring tension), the screw exposed length is about 60-80MM (that is the distance from the top of the nut to the screw).

The correct spring situation is the bed can stop in the open angle of 30° , the bedstead would not appear to rebound after landing, back and forth debugging to the best of the situation.
